Disorders of the Monocyte Macrophage System: Pathophysiological and Clinical Aspects (Haematology and Blood Transfusion Hämatologie und Bluttransfusion)

The origin and function of normal monocytes and macrophages have been clearly defined by extensive investigations in human and in animal models. The central importance of this cell system for the biological defense mechanisms is well established: phagocytosis, inactivation and destruction of organic and inorganic materials, an important role in the initiation of humoral and cell mediated immunological responses, and the secretion of a variety of chemical mediator and effector substances are the most important features of this ontogenetically ancient cell system. However, the data on this cellular system are rather recent, and this may explain why relatively little attention has been paid to the pathology of the monocyte-macrophage system (MMS) until now. In addition, this monograph should focus attention on the secondary pathophysiological implications of the MMS in disorders not primarily originating from this system. Several techniques are available to identify even abnormal individuals of this cell system and, therefore, can be employed for the study of severely altered or neoplastic monocytic cells.
